

SQL – Practice Questions

Assume the table is:

```
customer(CustID, Cust_name, City, Age, Amount, Mode, Payment_date)
```

♦ LIMIT & ORDER BY

1. Display the **5 customers who have made the highest payments**, showing only `Cust_name`, `City`, and `Amount`.
 2. Display the **3 youngest customers** from the table, starting with the youngest.
 3. Display the **second-highest 5 payment amounts** using `ORDER BY` and `LIMIT`.
 4. Display all customers sorted first by **City in ascending order** and then by **Amount in descending order**.
-

♦ String Functions

5. Display each customer's name in uppercase along with their city in lowercase.
6. Display the customer name and the **number of characters in each name**. Sort the result from the longest name to the shortest.
7. Display the **first 4 characters** of each customer's name along with their `CustID`.
8. Display the customer's first name and city together in the following format:

`Rahul - Burhanpur`

Use `CONCAT()`.
9. Find customers whose names contain the letter `a` and display their names in uppercase.
10. Display each customer's name after replacing all occurrences of the letter `a` with `@`, and sort the result alphabetically.
11. Create a result showing:

```
Customer Name | Name Length | Uppercase Name
```

Use `LENGTH()` and `UPPER()` together.

◆ Aggregate Functions

12. Find the **total amount, average amount, highest amount, and lowest amount** paid by all customers in a single query.
 13. Find the **total number of customers** and the **average age** of customers.
 14. Find the average payment amount and display it rounded to **2 decimal places**.
 15. Find the total payment amount made through a particular payment mode, such as `UPI`.
-

◆ GROUP BY

16. Find the **number of customers in each city** and display the cities with the highest number of customers first.
17. Find the **total payment amount for each city** and sort the result from highest to lowest total payment.
18. Find the **average payment amount for each payment mode**.
19. Display each city along with:
 - Number of customers
 - Total payment
 - Average payment
 - Highest payment

Use `GROUP BY`.

◆ HAVING – Moderate Challenge

20. Find cities where:
 - There are **at least 3 customers**, and
 - Their **total payment amount is more than ₹10,000**.

Display:

City | Customer Count | Total Amount

Hint: You will need `GROUP BY`, `COUNT()`, `SUM()` and `HAVING`.
